

Rivers
by
Travis Lucky

*A single trickle of water grows into a clear, cold stream.
Creek flows slowly down a windy valley, multiplying.
Many little creeks merge to become rivers.
Small rivers emerge to form the Columbia River.*

*Small fish swim up the river to spawn.
Little fish eating the dead salmon.
Red salmon eggs in the rocks.*

*Little rivers flow into the Columbia.
Picking up speed as the river gets bigger.
The current churning, swirling, twisting as it get's closer to the ocean.*

*The clear river water crashes into the crisp ocean.
Blending colors and densities to create a nursery for young Salmon.
Where ocean, river, and land meet, creatures thrive.
The colors of life mix to form a great habitat for wildlife.*

Rivers are life.
